

Integration Solution

Provides direct access to CPS content within your clinical management system.

Healthcare practitioners in Canada continue to struggle with increased demands and expectations to be more efficient in their practices while still improving patient outcomes.

Although great advancements have been realized with the introduction of interfaces such as lab data, hospital and consult reports into the EMR/EHR systems, clinicians continue to struggle accessing critical drug and therapeutic information at the point of care.

Doctors, nurses and other health professionals are forced to disrupt their EMR flow during the point of care in order to launch another application, open a separate device, or utilize another workstation to research or consult a decision support tool to complete an assessment, or determine an appropriate treatment option.

The CPS utilizes Canadian Health-Canada approved drug information. And is available in both official languages.

The solution can be seamlessly integrated to:

- provide access to critical drug and therapeutic information
- help reduce medication errors
- ensure users have the latest evidence-based therapeutic information at the point of care
- improve patient outcomes

The CPhA Integration Solution is a powerful clinical decision support tool to assist clinicians in providing better patient care without workflow disruptions.

To determine if CPS integration is the right tool for your EMR/EHR please contact Jody Franklin.
